SUMMARY

AI/ML student focused on building end-to-end systems in financial NLP, real-time inference, and recommendation engines. Experienced in developing production-style pipelines integrating LLMs, APIs, and edge deployment.

EDUCATION

Atlas SkillTech University

Bachelor of Technology in Computer Science, Artificial Intelligence & Machine Learning

Mumbai, Maharashtra

Graduation Date: Jun 2027

WORK EXPERIENCE

Plattr.io

AI Intern | Flask, OpenAI API, Anthropic API, FMP API

Navi Mumbai Maharashtra

May 2025 - July 2025

- Built an end-to-end financial analysis pipeline using SEC-API, processing 45+ 10-Q filings and converting raw EDGAR data into structured datasets (18 metadata fields, 14-field exports).
- Engineered a multi-stage pipeline (querying, text extraction, chunking, transformation, LLM analysis) and developed 14 REST API endpoints for filings, insider trades, transcripts, and multi-mode analysis.
- Integrated OpenAI and Anthropic models with chunked processing (up to ~8MB documents), extracting structured financial insights including metrics, risks, and key company signals.

OutPulse (Open-Source)

Software Engineer | YOLOv11, LiDAR

Mumbai, Maharashtra

Dec 2024 - Feb 2025

- Trained a YOLOv11-based object detection model on 962 images (1,736 annotations) for cone detection, using data augmentation and fine-tuning over 100 epochs (batch size 16, 320×320 resolution).
- Built real-time inference pipelines using OpenCV for webcam and video input, implementing real-time detection workflows from input frames to bounding box outputs.
- Deployed a lightweight (~5.5 MB) model for edge-compatible inference and exported ONNX format for cross-platform deployment, enabling efficient integration into embedded systems.

SKILLS

Python, SQL | ML/AI: Scikit-learn, NLP | Data: Pandas, NumPy | Visualization: Power BI | Tools: Flask, MongoDB, MySQL

PROJECTS

1. AI-Based Phishing Detection System ([Link](#))

- Built a phishing detection system on 164K+ emails using NLP, URL, and HTML-based features for multi-signal classification.
- Trained a Naive Bayes model on a 20K+ token vocabulary, achieving 96.7% accuracy and 0.953 F1-score with low false positive rate (~1.9%).
- Developed a real-time system with REST APIs and a browser extension, enabling sub-100ms inference and supporting incremental retraining via feedback-driven pipelines.

2. Anime Recommendation Engine ([Link](#))

- Built a hybrid recommendation system using the MyAnimeList dataset (4.7K users, 500 items, 5K interactions) with matrix factorization and item content features for personalized ranking.
- Implemented a custom NumPy-based training pipeline (gradient descent, 46-dimensional latent factors), achieving RMSE of 0.1368 and MAE of 0.1227 on observed ratings.
- Implemented efficient inference using serialized models (.pkl) for fast recommendation generation.

3. Credit Card Default Prediction ([Link](#))

- Built a credit risk prediction model using decision trees, performing feature engineering and hyperparameter tuning (GridSearchCV) to improve accuracy from 72.6% to 81.8%.
- Evaluated model performance using Precision, Recall, F1-score, and ROC-AUC (0.744), and analyzed feature importance to identify key drivers of default risk.
